Students at your hometown high school have decided to organize their social network using databases. So far, they have collected information about sixteen students in four grades, 9-12. Here's the schema:

Highschooler (ID, name, grade)

English: There is a high school student with unique *ID* and a given *first name* in a certain *grade*.

Friend (ID1, ID2)

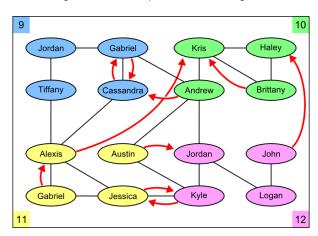

English: The student with ID1 is friends with the student with ID2. Friendship is mutual, so if (123, 456) is in the Friend table, so is (456, 123).

Likes (ID1, ID2)

English: The student with ID1 likes the student with ID2. Liking someone is not necessarily mutual, so if (123, 456) is in the Likes table, there is no guarantee that (456, 123) is also present.

Your queries will run over a small data set conforming to the schema. View the database. (You can also download the schema and data.)

For your convenience, here is a graph showing the various connections between the students in our database. 9th graders are blue, 10th graders are green, 11th graders are yellow, and 12th graders are purple. Undirected black edges indicate friendships, and directed red edges indicate that one student likes another student.

Instructions: Each problem asks you to write a query in SQL. When you click "Check Answer" our back-end runs your query against the sample database using SQLite. It displays the result and compares your answer against the correct one. When you're satisfied with your solution for a given problem, click the "Save Answers" button to save your progress. Click "Submit Answers" to submit the entire exercise set.

Important Notes:

- $\bullet \ \ \text{Your queries are executed using SQLite, so you must conform to the SQL constructs supported by SQLite.}$
- Unless a specific result ordering is asked for, you can return the result rows in any order.
- You are to translate the English into a SQL query that computes the desired result over all possible databases. All we actually check is that your query gets the right answer on the small sample database. Thus, even if your solution is marked as correct, it is possible that your query does not correctly reflect the problem at hand. (For example, if we ask for a complex condition that requires accessing all of the tables, but over our small data set in the end the condition is satisfied only by Star Wars, then the query "select title from Movie where title = 'Star Wars'" will be marked correct even though it doesn't reflect the actual question.) Circumventing the system in this fashion will get you a high score on the exercises, but it won't help you learn SQL. On the other hand, an incorrect attempt at a general solution is unlikely to produce the right answer, so you shouldn't be led astray by our checking system.

You may perform these exercises as many times as you like, so we strongly encourage you to keep working with them until you complete the exercises with full credit.

Q1

1.0/1.0 point (ungraded)

For every situation where student A likes student B, but student B likes a different student C, return the names and grades of A, B, and C.

Note: Your queries are executed using SQLite, so you must conform to the SQL constructs supported by SQLite.

```
2 FROM (SELECT H1.name AS AName, H1.grade AS Agrade,

H2.name AS BName, H2.grade AS Bgrade,

H3.name AS CName, H3.grade AS Cgrade,

A, B, ID2 AS C

FROM Likes, (SELECT ID1 AS A, ID2 AS B FROM Likes

WHERE ID2 IN (SELECT ID1 FROM LIKES)

AND ID1 NOT IN (SELECT L1.ID1 AS ID FROM Likes AS L1, Likes AS L2

WHERE L1.ID1 = L2.ID2 AND L2.ID1 = L1.ID2)),

Highschooler AS H1, Highschooler AS H2, Highschooler AS H3

WHERE ID1 = B AND H1.ID = A AND H2.ID = B AND H3.ID = C)
```

Press ESC then TAB or click outside of the code editor to exit

Correct

Correct

Your Query Result:

Andrew	10	Cassandra	9	Gabriel	9
Gabriel	11	Alexis	11	Kris	10

Expected Query Result:

Andrew	10	Cassandra	9	Gabriel	9
Gabriel	11	Alexis	11	Kris	10

Submit

Q2

1.0/1.0 point (ungraded)

Find those students for whom all of their friends are in different grades from themselves. Return the students' names and grades.

Note: Your queries are executed using SQLite, so you must conform to the SQL constructs supported by SQLite.

```
1 SELECT name, grade
2 FROM Highschooler
3 WHERE ID NOT IN (SELECT H1.ID
4 FROM Friend, Highschooler AS H1, Highschooler AS H2
5 WHERE ID1 = H1.ID AND ID2 = H2.ID AND H1.grade = H2.grade)
```

Press ESC then TAB or click outside of the code editor to exit

Correct

Correct

Your Query Result:

Austin 11

Expected Query Result:

Austin 11

Submit

1.0/1.0 point (ungraded) What is the average number of friends per student? (Your result should be just one number.)
Note: Your queries are executed using SQLite, so you must conform to the SQL constructs supported by SQLite. 1 SELECT AVG(totFriends) FROM (SELECT COUNT(*) AS totFriends FROM Friend GROUP BY ID1)
Press ESC then TAB or click outside of the code editor to exit
Correct
Correct
Your Query Result:
2.5
Expected Query Result:
2.5
<u>2.5 </u>
Submit
Q4
1.0/1.0 point (ungraded) Find the number of students who are either friends with Cassandra or are friends of friends of Cassandra. Do not count Cassandra, even though technically she is a friend of a friend.
Note: Your queries are executed using SQLite, so you must conform to the SQL constructs supported by SQLite.
11709: ID of Cassandra 2 SELECT COUNT(ID1)
3 FROM Friend 4 WHERE ID2 = 1709 OR ID2 IN (SELECT ID1 FROM Friend WHERE ID2 = 1709) AND ID1 ⇔ 1709
Press ESC then TAB or click outside of the code editor to exit
Correct
Correct
Your Query Result:
Expected Query Result:

_	
Su	

Q5

1.0/1.0 point (ungraded)

Find the name and grade of the student(s) with the greatest number of friends.

 $\textbf{Note:} \ \text{Your queries are executed using SQLite, so you must conform to the SQL constructs supported by SQLite.}$

```
1 SELECT name, grade
2 FROM Highschooler
3 WHERE ID IN (SELECT ID1
4 FROM (SELECT ID1, COUNT(ID2) AS numFriends FROM Friend GROUP BY ID1)
5 WHERE numFriends = (SELECT COUNT(ID2) AS nf FROM Friend GROUP BY ID1 ORDER BY nf DESC LIMIT 1))
```

Press ESC then TAB or click outside of the code editor to exit

Correct

Correct

Your Query Result:

Alexis	11
Andrew	10

Expected Query Result:

Alexis	11
Andrew	10

Submit
